MEASURING CONTROLLING REGULATING

GREISINGER
— electronic —

A subsidiary of

Greisinger electronic plant

Our EMC test laboratory

The GREISINGER electronic GmbH was founded in Regenstauf on January 1, 1980 and has now been existing for over 30 years.

Our aim is the development and production of measuring and control equipment including suitable sensors.

Production occupies a working area of approx. 2250 m².

50 employees develop and produce our high-quality but for all that low priced devices using the most up-to-date development, production and inspection equipment.

The company owns a fully equipped screen cabin (5 x 3 x 2.5 m) where EMC tests are performed already during the development of new products.

Furthermore to mention is the 60 m² air-conditioned calibration lab for calibration and adjustment of e.g. temperature, pressure, humidity products.

For many applications, especially considering the ISO9000ff documented measurings are necessary.

All our references can be traced back to national references and are permanently controlled.

Most of our products also can be ordered with Calibration or DKD Certificates to fulfill your quality requirements according to ISO9000.

Quality Standard and Certification

Fair prices and high-quality products have made us a company to be reckoned with on the measuring device sector. Our development has been steadily going upwards for the past 30 years. Globally operating and well-known companies are now amongst our regular customers.

All our products are developed and produced in Germany - the only way to ensure the high-quality standard of our products. Our quality management system is certified according to ISO 9001:2008 and additionally for potentially explosive atmospheres according to EN 13980:2002.

Products intended for use in explosive atmospheres have to comply the requirements of the Directive 94/9/EC („ATEX-directive“) since July 1.st 2003.

Development, production and marketing are certified according to Directive 94/9/EC since May 1.st 2003. Several products are already examined and certified according to the Directive 94/9/EC.

Calibration and Certificate

all from one source

	for return to national standards	
1. Readjustment	2. Factory Calibration Certificate	3. DKD Calibration Certificate
After a longer period of use, it's recommendable to send in the devices (e.g. humidity) for readjustment. At this, the device will be fully checked up and new adjusted, if required.	DIN EN ISO 9000ff demands a traceable calibration of measuring and test equipment. This calibration certificate is a low-priced alternative to the DKD Calibration Certificate.	The DKD Calibration Certificate always conforms to form, structure and procedures the standards and requirements of the German Calibration Service according DIN EN ISO 17025.

Which certificate will be required ?

Factory Calibration Certificate: could be deemed to be sufficient, if the devices acts as measuring and test equipment within quality management systems according to DIN EN ISO 9000ff or similar, as long as there are not used as a standard. Furthermore there are some measurement categories, without possibility to get a DKD accreditation.

DKD-Calibration Certificate will be recommended for the recalibration of testing equipment which itself is used as a standard for the monitoring of other measuring and test equipment. It's also possible that internal demands of the particular companies makes a DKD Calibration Certificate necessary.

1. Readjustment: (without certificate of calibration) Readjustment of the device

2. Factory calibration certificate:

Calibration certificates are available for all handheld instruments marked with the symbol .

Also possible for measuring transmitters resp. combinations of display instruments and sensors/transmitters.

Calibrated Systems

General

The overall error of a measuring consists of the sum of the instrument error and the probe error. To minimise the overall error, we offer calibrated and optimized systems below.

Due to their excellent system accuracy they are especially suitable for quality assurance according to ISO9000ff, as reference instruments in manufacturing processes, laboratory, service and maintenance, etc.

The system optimization is done via a special characteristic curve which is determined for each temperature probe separately and stored in the instrument (GMH3750) or. with probe adjusting via offset and slope input (GMH3710).

Scope of supply:

Measuring device GMH 3750 or GMH 3710, temperature probe GTF 401 1/3 DIN, plastic case GKK 3500 and certificate of calibration with 3 calibration points.

Press button to set the difference display 'probe 1 - probe 2' to zero.

Analog output:

0 ... 1V, freely adjustable (resolution 13bit, accuracy 0.05% at nom. temp.)

Min-/Max-alarm:

The meas. values of probe 1 or 2, probes 1 and 2 or the temp. difference are constantly monitored reg. the min. and max. values set.

- Alarm: 3 different alarm settings

Material Moisture Measurement with GREISINGER handheld instruments

• Resistive measuring method

(GMR 100, GMH 3810, GMH 3830, GMH 3850)

The electrical resistance often depends on the material moisture. Therefore the devices measure the (possibly extremely high) values of resistance and convert them to the displayed value by means of integrated characteristic curves. The temperature has to be compensated especially at the measurement of wood – all GREISINGER-instruments have an integrated temperature compensation. In most cases the contact is realised by nails that are driven into the material are used to contact.

• Capacitive measuring method

(GMK 210, GMK 100, GMI 15)

The dielectric properties of an object are often a good indicator for its material moisture. The dielectric coefficient of water is considerably higher than that of dry lumbers or building materials. Therefore the total dielectric coefficient of the measuring object can be easily used to get its material moisture. For the measurement the device has to be applied on the material. Precondition therefore: planar surfaces, no metallic elements.

- Another method is to measure the material moisture indirectly by means of the **relative humidity** (i.e. with GMH 3330 + TFS 0100 E): The humidity in a sealed hole within a material depends on the material moisture. By means of a so-called sorption isotherm or a corresponding table the material moisture can be calculated from the humidity.

- The **oven dry method** can be used for reference point measurement with highest accuracy.

The moist material is weighed and afterwards dried at increased temperature until no weight loss is detectable anymore. The material moisture can be calculated from the moist and arid weight.

Units

- Material moisture u (also „atro“): relating to dry mass

material moisture u [%] =
 $(\text{mass wet} - \text{mass dry}) / \text{mass dry} * 100$

Particularly important for carpenters, joiners, etc.

- Moisture content w : material moisture related to wet total mass

moisture content w [%] =
 $(\text{mass wet} - \text{mass dry}) / \text{mass wet} * 100$

Particularly important for the evaluation of combustibles.

- “Digit“ (GMI 15)

The displayed value is relative, that means without a physical unit. This can be used to get comparative moisture information of the same materials. Lower values indicate less moisture, higher values indicate therefore more moisture.

For further information on this topic please see the devices' manuals and our homepage www.greisinger.de under Download -> Documents

Capacitive moisture detection

without damaging of material up to 4 cm of depth

Indicator for moisture in wood and buildings

GMI 15

Device for high-speed determination of moisture in buildings, contracting work etc.

The GMI 15 allows detection of moisture in wood down to a depth of approx. 3 cm and in concrete or wash floor down to a depth of approx. 4 cm. Detection of moisture behind ceramic tiles and/or various wall or floor coverings. To check moisture simply place device on the surface to be measured - no injection into the measuring object required.

Application:

Humidity indication for i.e. estate agents (for fast control state of buildings), property management, house owners, architects, building experts, building contractors, mobile homes (moist in insulations), polyester / GRP boats

Note: The GMI 15 is an indicator for the fast estimation - it does not replace precision instruments like the GMH 3810, GMH 3830 and GMH 3850

Specification:

GMK 210

The GMK 210 is a capacitive material moisture measuring device with direct moisture display in percent. It is optimally suited for home and handcraft. Depending on the application, it is possible to display the material moisture "u" or the water content "w".

The humidity is measured by a measuring plate on the back of the device. With a side-mounted switch the measuring depth can be changed. With the help of measurements in different depth a statement could be made if for example the material dries already or if the moisture is just on the surface of the material.

GMH 3850 Resistive material-moisture and temperature measuring device, access. not included with data logger and user programmable material curves

Description:

the GMH3830 offers important advantages in handling, user-friendliness, functional range and accuracy for your metrological work.

The absolute moisture content of 494 materials is displayed directly. The cumbersome usage of calculation tables now is history. Additionally you get a evaluation of your material state (wet/dry) of nearly all materials instantly. Of course the formerly used wood groups A, B, C and D of the predecessor models are further more supported.

General application:

precision measurements in cut wood, chip board, veneer, sawdust, wood chips, wood wool, flax, straw, hay, concrete, gas concrete, bricks, wash floor, cast, limestone mortar, cement mortar, paper, carton, textiles etc.

User:

architect, expert, inspector, building contractor, painter, carpenter, parquet joiner, floor tiler, wood works, timber desiccation plant, building repair company, textile industry etc.

Datalogger (only GMH 3850):

This instrument is indispensable for the documentation of material state by quality assurance systems.

By means of the integrated data logger there can be recorded up to 10000 measuring values and processed on demand. Additionally there can be 4 material curves individually programmed to acquire data by reference measurements with dry ovens or CM-method. This instruments finally makes paper correction tables useless.

The measuring cell

The measuring head is designed without compromise. The holes ensure the well exchange of the measuring fluid, nonetheless the sensor is protected against mechanical loads. The integrated temperature sensor has very quick response time. Compared to simpler electrode designs the measurements are much more accurate and faster.

GLF 100:

Graphite used as material for the electrodes makes the applicability up to 100 mS/cm possible – a must have in seawater analytic

GLF 100 RW:

Universal applicability at highest standards is made possible by the use of stainless steel electrodes (1.4404, 1.4435).

Auto-Hold: automatic freezing of a constant measuring value

Auto Power Off: device is automatically switched off after a selected period if unused (0 to 120 min, or deactivated)

Additional Display for Battery and Low Battery Display "BAT"

General:

Carbon monoxide (CO) is created by the combustion of carbon. Depending on the effectiveness of the combustion (oxygen supply) and the temperature of the combustion more or less CO gas is created. The gas is inflammable and highly toxic. It is invisible, tasteless, scentless and lighter than air.

Even smallest concentrations are dangerous for humans!

Therefore a directive exists in Germany, which limits the maximum concentration of CO gas at work (MAK / AGW) to 30 ppm

Application areas:

- Control of the air quality (e.g. at work place)
- Checking of heating systems, gas central-heating, fireplace
- Control of the air at maintenance work (tunnel, gas central-heating, ...)
- Detection of CO in the breath of smoker (% CO Hb)
- Cognition of CO poisoning i.e. at burnings (fire fighters, ...)

Suitable for measuring in normal atmosphere and in systems without or with slight under or over pressure. The sensor type features a screw thread and can be built in gas-tight in almost every system directly resp. with tube-adaptor.

GGO 370

universal applications, diving,

GGO 380

NEW

for low oxygen-concentration,
fast response time

open sensor type

- suitable for air- or gas-stream
- quick temperature compensation

Application:

Because of the special sensor construction the measuring gas streams optimally around the sensor and escapes through holes in the housing into the air. No pressure build-up at slight streaming of the probe, that falsify the result of measurement. Particularly suitable for measuring of gas out of gas-bottle etc. Even measuring indoor-gas concentration is possible.

Indoor climate monitoring CO₂ monitoring

NEW

AirCheck 100

The indoor climate should be monitored to avoid exhaustion, lacking concentration and sickness (sick-building-syndrome) due to poor air quality.

The AirCheck 100 is a universal device for fast and continuous monitoring of the indoor climate. The air quality is rated according to its CO₂ content measured with the internal long-term stable and maintenance-free infrared sensor (NDIR). After turning-on the AirCheck 100 automatically executes an offset calibration but a manual calibration is possible, too.

The CO₂ content is shown on the large and well readable display together with a 3-stage rating of the ambient air (good, normal, poor). The AirCheck can be configured to optically as well as acoustically (80dB) remind to ventilate on time by 2 adjustable alarm boundaries. Temperature and air humidity measurement, real-time clock and calendar complete the device's features.

Application:

- training, conference and break rooms
- housing rooms
- offices, laboratories
- public buildings, schools
- etc.

General functional description:

Tare function: display value and the min./max values memorized can be set to zero.

Hold function: by pressing a button the current meas. value will be memorized.

Min./Max. value memory: memorizing of max. and min. values.

Peak value memory (peak-detect): In the min-/max-value memory will be detected not filtered pressure peaks ≥1msec.

Averaging function: integrates the meas. values during a selectable period of time and then calculates the average display value.

Logger operation: Logger start and stop via the keyboard or interface. Comfortable read-out and display software (GSOFT3050) available as additional equipment.

Low power logger mode: (only in meas. cycle "slow") Only one measurement carried out at the end of the respective logger cycle. The battery life is considerably prolonged.

Min-/Max-alarm: the measuring value is constantly monitored if they remain within the min./max. limits set (deactivatable)

- Alarm: 3 different alarm settings
"off" - alarm function deactivated
"on" - visual alarm via display, interface alarm, alarm sounded via integrated horn.

"no.So." - visual alarm via display and interface alarm

- Controlling function: with the help of the switching module GAM3000 (optionally) electric equipment can be switched on/off or alarm memorized (see accessories)

SeaLevel-correction: when connecting an abs. pressure probe the barom. air press. can also be displayed corrected to sea level "zero". (Air pressure comp. achieved by entering the meters above sea level "zero")

General function description:

Tare function: display value and the min./max values memorized can be set to zero.

Hold function: by pressing a button the current meas. value will be memorized.

Min./Max. value memory: memorizing of max. and min. values.

Serial interface: direct connection to RS232 or USB interface of a PC via electrically isolated interface adapter GRS 3100, GRS 3105 or USB 3100 N.

Power-Off-function: device will be automatically switched off if no operating takes place for the time of the power-off delay.
Selectable values: off, 1 ... 120 min.

Peak value memory (peak-detect):

In the min-/max-value memory will be detected not filtered pressure peaks ≥1msec.

Logger operation: Logger start and stop via the keyboard or interface. Comfortable read-out and display software (GSOFT3050) available as additional equipment.

Low power logger mode: (only in measuring cycle "slow") Only one measurement carried out at the end of the respective logger cycle. The battery life is considerably prolonged.
For long-term recordings (eg. tightness).

Averaging function: integrates the meas. values during a selectable period of time and then calculates the average display value.

Min-/Max-alarm: the measuring value is constantly monitored if they remain within the min./max. limits set (deactivateable)

- **Alarm:** 3 different alarm settings

- "off" - alarm function deactivated
- "on" - visual alarm via display, interface alarm, alarm sounded via integrated horn.

"no.So." - visual alarm via display and interface alarm

- **Controlling function:** with the help of the switching module GAM3000 (optionally) electric equipment can be switched on/off or alarm monitored (see accessories)

A GDUSB 1000 in fast mode can output up to 1000 measured values per second. The provided software displays the data and records for later usage.

The software can be configured to start or stop the recording with several selectable trigger conditions

Standard mode:

A GDUSB 1000 in standard mode can be responded similarly to GMH handheld devices or EASYBus modules (up to 32 measurements per second).

Then a long term recordings can be archived with the software EBS 20M / EBS 60M (2 measurements per second).

Switching modules:

GAM 3000 Switching module for the GMH3xxx-series

The GAM 3000 is an alarm or control output for the devices of the GMH3xxx-series with alarm output function. The GAM 3000 is controlled via the serial interface of the GMH3xxx. The setting of the alarm/switching limits are carried out the GMH3xxx as usual. You can choose between 2 different switching modes:

- **Alarm output:** Relay switches when the measuring value is no longer within the min./max. alarm limit values or an error state occurs at the set channel.
- **Control output:** In this case the min./max. values are not used as alarm points but as on/off switching points. In case of an error state the relay switches in its preferred state "off".

The desired switching function can be selected via an externally accessible miniature switch.

Power supply: 220 / 240 V, 50 / 60 Hz

Switching output: controlled power socket, selector switch to choose switching state normally-open or normally-closed

Switching power: 10 A (ohmic load)

GMH-connection: GMH3xxx interface and supply (integrated power supply 10.5V/10mA) via 1 m cable each, permanently connected to GAM 3000.

Dimensions: (controller) 112 x 71 x 48 mm (H x W x D)

Hand-held instruments - software

Operation for GMH 3xxx / GMH 5xxx - logger device

GSOFT 3050

Windows-software for the setting, data read-out and printing of all data stored by devices of the GMH3xxx- and GMH5xxx-series with logger.

General advice:

With GSOFT3050 you are able to operate the logger function of the GMH3000- and GMH5000 hand-held series. The logger recordings can be started, stopped, read in and displayed. It is also possible to operate several instruments simultaneously and to display their data in mutual diagrams. Data will be read via the serial interfaces 'COM 1' - 'COM 255' of your PC and an interface adapter (GRS 3100, GRS 3105, USB 3100 N ...).

Software is multilingual, the language can be selected simply in the programme. Executable with Windows 98, Me, NT, 2000, XP, Vista and 7.

The GSOFT3050 offers, among others, the following functions:

- **Display of the GMH-information**
- **Setting of the alarm function** for GMH3xxx and GMH5xxx devices.
- **Operation of the logger function**
simple selection of the logger function (cyclic or manual), setting of cycle time, logger recording start and stop, read-out of logger data.
- **Diagram display of logger data**
The logger data can be displayed in form of a diagram. It is possible to display various measuring sequences in one diagram. The diagram offers the following functions:
 - display including real-time axis, zooming of display view
 - display of legend can be switched on/off
 - marking of measuring points can be switched on/off
 - a new/existing measuring sequence can be added/deleted at any time
- **Logger data print-out**
Data can be printed as tables (complete measuring sequence or limited area) or as diagram (in accordance with the current diagram window).
- **Memorizing of logger data**
The logger data can be saved in files and, therefore, called up again at any given time without a connected device.
- **Export of logger data to ASCII (text) file format**
- **Memorizing of windows**
Data and diagram windows can be placed at any desired. The setup of the windows can be stored as 'view'.

General

The universal controller **GIR 2002** is the ideal device for simple control systems (on/off switching, relay outputs, ...), because of its compact construction and its high ease of use.

The **GIR 2002 PID** (basic version) supplies one control output for a 2-point-control the types of control **P, I, PI, PD or PID** and a second control output for on/off switching.

The device can also be configured as a **3-point motorized valve controller** or as controller with **continuous output** (optionally).

General (continuance)

Due to the **universal input** and the various **switching functions** the controller can be optimally adapted to the requirements of the system.

The structured menu navigation allows a straightforward handling and a fast adjustment of the parameters.

A **LED switching position display** gives information to the user about the current status of the switching outputs.

The **automatic self-test and diagnostic system** ensures maximum operational safety and reports systems errors by conclusive error codes.

The parameters are automatically saved, so that all data will be maintained even in case of a power blackout.

Among others most of the GREISINGER transmitters, rpm sensors and flow rate sensors can be connected directly to the **integrated transmitter power supply** (24VDC/22mA) of the controller.

EASYBus - sensor modul for carbon dioxide (CO₂)

E.A.S.Y. Bus
- Modul

EBG - CO2 - 1R

Properties

Due to the fact, that CO₂ is an important indicator for the quality of air in rooms, it's super important to measure the CO₂ content.

The recommended CO₂ limit value for ambient air is 1000 ppm . An exceeding of this limit causes tiredness and a loss of concentration.

The high quality and precise CO₂-module works according to the infrared principle (NDIR). An auto-calibration procedure compensates aging effects and is responsible for an excellent long term stability of this CO₂-module.

Additionally, there is a local display which shows beside the actual CO₂ concentration, the minimum and maximum values as well as an optical alarm.

Highlights:

- auto-calibration procedure
- auto-calibration procedure
- for surveillance of the recommended CO₂ concentration in ambient air

GSOFT 40K (incl. connection cable EBSK01)

Operating software for EASYLog and T-Logg datalogger

GSOFT40K is the comfortable operation software for the very easy operation of the **EASYLog's** and **T-Logg's**. The software supports English, German and Czech language and is executable with Windows 98, Me, NT, 2000, XP, Vista and 7.

Comfortable user interface - the essentials on a glance:

The programme is menu driven, the most important commands are additionally available in a toolbar. Whenever necessary the software gives hints and messages. Therefore any user with a few basics about how to operate standard Windows software will be able to operate it. Loggers can be connected, started and read out by single mouseclicks.

Display of logger state informations

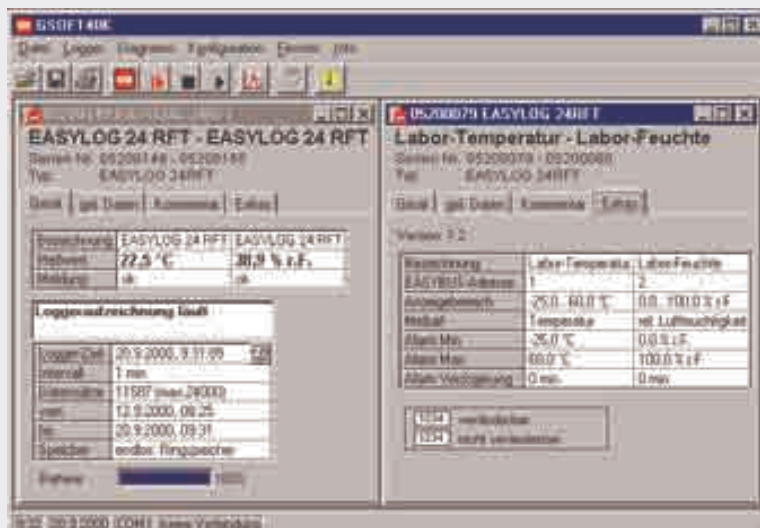

All necessary informations are compressed to a single clearly arranged window for each connected logger.

Setting of special functions

The loggers are supporting alarm functionality - easily configurable by the GSOFT 40K Software. All other important logger settings are displayed, too. E.g. a label up to 16 characters long can be assigned to each logger channel, which is stored in the logger. You may for example label the location or other useful details by using this function.

Additional entering of remarks

If You have read out a logger and want to store the data on disk or harddisk there is the possibility to additionally enter remarks of any length for each recording, for example to describe and comment unusual occurrences during the recording.

The data: Tables and diagrams

After reading out the recordings the data will be displayed in form of a table. With the diagram the data of several loggers can be displayed simultaneously. Additional diagram functions:

- labelling of measuring values
- real time axis
- zooming of any section within the diagram
- legend (inactivate able)
- measurement cursor (inactivate able)
- marking of measurings with symbols (inactivate able)

The main target of the design of GSOFT40k was most easiest operationability, therefore just a few easy mouseclicks are necessary to display data fast and clear. Both diagrams and tables are displaying the data in realtime, even daylight savings time settings are taken into account automatically. And of course tables and diagrams can be printed out.

E.A.S.Y.Bus & simultaneous operation and display of several loggers

Because of the EASYBus more than one logger can be connected at the same time at a single serial PC interface. Distances of up to 1000 m can be covered. To simplify operation all connected loggers can be operated at the same time. This reduces the expense of operation time and even largest EASYBus-systems can be controlled easily.

Remote operation via conventional and mobile telephone nets

With GSOFT 40K loggers can be operated and read out via any distance by the means of the conventional or the mobile telephone nets. Because of this feature measuring values and recordings can be collected centrally covering distances of hundreds of kilometers. (p.r.t. page 94)

Automated Read Out

All loggers connected directly or via conventional an mobile telephone nets can be read out automatically. The points of time can be entered separately (e.g. each day for each week ... at X.XX o'clock), the read out data will be archived on hard disk. The system gets even more reliable and the handling of multiple loggers gets much easier.

Export function

To be able to use the logger data with other software applications (EXCEL, WORD,...), a flexible export function is integrated. The data can be converted to textfiles which can be processed by all popular programmes.

Temperature Switch

TF1 ...

General

A totally sealed bimetal thermostat opens or closes when the pre-fixed switch value is over-rated or undercut.

Sensor has to be fully wetted. Switch value is indicated for increasing temperature 2K/min.

TF1 thermostats just monitor the temperature. A regulation is due to the huge hysteresis not possible.

- optional installation
- compact dimensions
- n.o. or n.c. position
- metering substances: water, gas/air, oil

GSMU 575

Properties

The transmitter is for measuring air velocity. The measurement method is based on the hot-film anemometer principle, for that purpose, a special thin-film sensor element has been developed. An accurate and reliable determination of the air velocity depends on the correct positioning of the sensor probe in the air stream. Accurate measurements are only possible if the sensor probe is installed where there is no turbulence.

- heating, ventilating
- air conditioning technology
- supply air control of ovens

Water level / well probe Tank contents meas. probe

GBS 01

For simple and inexpensive applications. Suitable for permanent level measuring in tanks, rivers, lakes, drinking-water wells, drilling holes, waste water plants...

GBS 02

For measuring the level of fuel and other aggressive media. The sensor is highly precise, insensitive to lateral flow and offers optionally lightning protection and other output signals (e.g. 0-10V). For measuring of gasoline please order ex-design.

Description: piezoresistive pressure sensor with temperature compensation. Welded, non-corrosive design with integral and additionally sealed water-proof connecting cable. The pressure compensation is done via a cable-integrated air path to the atmosphere. A special feature is the lateral flow resistance, which prevents media ingress. Therefore only the cable has to be replaced in case of a corresponding defect.

CO₂-Transducer

GT10 - CO₂ - 1R

Properties

Due to the fact, that CO₂ is an important indicator for the quality of air in rooms, it's super important to measure the CO₂ content.

The recommended CO₂ limit value for ambient air is 1000ppm. An exceeding of this limit causes tiredness and a loss of concentration.

The high quality and precise CO₂-transducer works according to the infrared principle (NDIR). An auto-calibration procedure compensates aging effects and is responsible for an excellent long term stability of this CO₂ transducer.

Due to the freely adjustable output signal the transmitter could be used for nearly each existing controller input etc..

Additionally, there is a local display which shows beside the actual CO₂ concentration, the minimum and maximum values as well as an optical alarm.

Highlights:

- excellent long term stability
- auto-calibration procedure
- for surveillance of the recommended CO₂ concentration in ambient air
- output signal free scaleable

Level Switch

GNS-C1 (with 1 microswitch)

GNS-C2 (with 2 microswitches)

Properties

These level switches offer the most reliable solution for liquid level control where side mounting system is required. The small outlines, the materials and the mounting versatility make this unit one of the level switches more required by the market. The GNS are also suitable for use with process temperature up to 180 °C.

Average temperature probe

MWF 100 Pt100 (2-, 3- or 4-wire)

General description

The bendable average temperature probes are measuring the average temperature over the whole length of the probe and not like the standard probes only on the sensor tip.

There are short probe length of a little centimetres as well as length of any metres (e.g. 30 m) feasible.

Application area: Measuring of the average value at long heating or cooling elements, air ducts etc.

Tell us your requested application. We will offer you the an individual sensor construction !

"Cement-On" thermocouples

General description

The series GOF 120 are a model line of Cement-On, fast response thermocouples for fast surface temperature measurement. The model line have 3 different styles. (Please order the high temperature cement separately)

The **design styles 1 and 2** are made from 0.013 mm thermocouple alloy foil by a special process where the butt welded thermocouple junction is 0.013 mm in thickness. The thermocouples are fabricated from class 1!

These styles are flat, extremely low inertia construction and are ideal means of measuring the temperature of both flat and coured metals, plastic and ceramic surfaces where very fast response is desired.

The **design style 3** is an economy version constructed from 0.25 mm diameter bead welded standard limit of error thermocouple wire. It should be used where extremely fast response time is not essential.

GOF 120 - K1 NiCr-Ni, cable length 90 cm, max. 260°C (short-time: 370°C)

GOF 120 - K2 NiCr-Ni, cable length 15 cm, max. 540°C (short-time: 650°C)

GOF 120 - K3 NiCr-Ni, cable length 90 cm, max. 260°C (short-time: 370°C)

OB-700 high temperature chemical set cement, 235 ml (max. 871°C)

Highlights:

- ultra fast response time
(style 1: t_{63} = approx. 20 ms, style 2: approx. 5 ms, style 3: approx. 300 ms)
- very low thermal inertia
- also available with thermocouples type J (only design 3), T and E
- style 1 and 3 optionally available with other lengths

Please note: cannot be used with high temperature cement (will break down insulation)

ALSCHU 300 FG

Electrode controller in **field frame** for wall mounting – device without sensor

ALSCHU 300 SP

Electrode controller in **snap-on housing** for DIN rail mounting – device without sensor

Applications:

Automatic control of drainage pumps and wastewater lifting plants, overflow and low liquid level control, automatic filling and draining of tanks, level control of liquid reservoirs, aquariums, storage tanks, etc.

The ALSCHU 300 .. is especially suitable for detection of conducting media (water, etc.). It is less applicable for badly or non conducting media (oils or fatty liquids), conducting foaming liquids or media causing electrically isolating deposits on the electrodes.

Description:

The measuring method for level detection is based on the conductive principle, i.e. the electrical conductivity of the media is monitored. If the switching amplifier detects a value below the set conductivity the state "media detected" is output, otherwise "no media". Depending on number and design of the connected level sensors the device can be used for level detection (min-/max- detection) or as 2-point controller.

ALSCHU 480 P

as above, but with volt-free switching output

Description:

The ALSCHU 480(P) is a versatile alarm and protection device. Its universal input (3.5mm jack bush) allows a lot of different external sensors to be connected. That includes sensors with a switching threshold <100kOhm like water sensors, float switches, level switches, magnetic contacts, safety shut-off mat etc. In case of an alarm the internal buzzer sounds and a connected device (i.e. pump, machine) is switched on or off via the Schuko adaptor plug (ALSCHU 480). The desired switching function can be set via selector switch I / II. ALSCHU 480P switches on/off external devices via a potential-free 2-pole switching output. The Schuko socket of ALSCHU 480P is always current-carrying.

Specification:

Protection device for universal application with switching output for any purpose panel mounted device

GEWAS 200

Panel-mounted alarm protection device with volt-free relay output (snap-on mounting for top hat rail in special snap-on housing) Without Sensor

The GEWAS 200 is a versatile DIN rail alarm and protection device. Its universal input (screw terminals) allows a lot of different external sensors to be connected. That includes sensors with a switching threshold <100kOhm like water sensors, float switches, level switches, magnetic contacts, etc. A connected device (i.e. pump, machine) is switched on or off via potential-free change-over contact in case of an alarm. The alarm is reset by the use of an internal / external reset button.

Specification:

Power supply: 220/240V 50/60Hz

Power consumption: approx. 3 VA

Sensor input: 2-pole screw terminal

Switching threshold: input resistance <100kOhm

Switching output: potential-free change-over contact

Switching power: 250VAC, 10A (ohmic load), max 2400VA

150VDC, 2A (ohmic load), max 240W

GEWAS 300 FG Water monitor in **field frame** for wall mounting – device without sensor

GEWAS 300 SP Water monitor in **snap-on housing** for DIN rail mounting – device without sensor

Applications:

Versatile alarm and protection device for DIN rail or surface mounting with universal input (screw-type terminals) for several external sensors. Sensors with switching threshold <100 kOhm can be connected (e.g. water probes, floating switches, level probes, magnetic contacts, etc.). In case of an alarm the connected device (e.g. pump, machine) is switched off by a change-over contact. The GEWAS 300 FG additionally provides an alarm. The internal or an external push-button resets the alarm state.

The GEWAS 300 .. is especially suitable for detection of conducting media (water, etc.). It is less applicable for badly or non conducting media (oils or fatty liquids), conducting foaming liquids or media causing electrically isolating deposits on the electrodes.

Description:

The measuring method for level detection is based on the conductive principle, i.e. the electrical conductivity of the media is monitored. If the switching amplifier detects a value below the set conductivity the state "media detected" is output, otherwise "no media".

Level module conductive

NEW

Figure with option rail adapter

GMNV-1C

General:

This module is used for evaluation of single levels with conductive level sensors. The module can be directly attached to the connection head of the level probes or snap on a hat rail with the optionally available rail adapter.

The GMNV-1C uses 3-wire connection technology and it converts the conducting connection between probe rod and ground to a DC switching signal. This signal can be directly interpreted and processed e.g. by a SPS.
